

# Package: glmmfields (via r-universe)

September 26, 2024

**Type** Package

**Title** Generalized Linear Mixed Models with Robust Random Fields for Spatiotemporal Modeling

**Version** 0.1.8

**Description** Implements Bayesian spatial and spatiotemporal models that optionally allow for extreme spatial deviations through time. 'glmmfields' uses a predictive process approach with random fields implemented through a multivariate-t distribution instead of the usual multivariate normal. Sampling is conducted with 'Stan'. References: Anderson and Ward (2019) <doi:10.1002/ecy.2403>.

**License** GPL (>=3)

**URL** <https://github.com/seananderson/glmmfields>

**BugReports** <https://github.com/seananderson/glmmfields/issues>

**Depends** methods, R (>= 3.4.0), Rcpp (>= 0.12.18)

**Imports** assertthat, broom, broom.mixed, cluster, dplyr (>= 0.8.0), forcats, ggplot2 (>= 2.2.0), loo (>= 2.0.0), mvtnorm, nlme, RcppParallel (>= 5.0.1), reshape2, rstan (>= 2.26.0), rstantools (>= 2.1.1), tibble

**Suggests** bayesplot, coda, knitr, parallel, rmarkdown, testthat, viridis

**LinkingTo** BH (>= 1.66.0), Rcpp (>= 0.12.8), RcppEigen (>= 0.3.3.3.0), RcppParallel (>= 5.0.1), rstan (>= 2.26.0), StanHeaders (>= 2.26.0)

**VignetteBuilder** knitr

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.2.3

**SystemRequirements** GNU make

**NeedsCompilation** yes

**Biarch** true

**Repository** <https://noaa-fisheries-integrated-toolbox.r-universe.dev>

**RemoteUrl** <https://github.com/seananderson/glmmfields>

**RemoteRef** HEAD

**RemoteSha** ddf3b77ca8bc1f45a370f365842c868b7c25dd84

glmmfields-package     *The 'glmmfields' package.*

---

## Description

Implements Bayesian spatial and spatiotemporal models that optionally allow for extreme spatial deviations through time. 'glmmfields' uses a predictive process approach with random fields implemented through a multivariate-t distribution instead of the usual multivariate normal. Sampling is conducted with 'Stan'.

`format_data`*Format data for fitting a glmmfields model*

---

**Description**

Format data for fitting a glmmfields model

**Usage**

```
format_data(  
  data,  
  y,  
  X,  
  time,  
  lon = "lon",  
  lat = "lat",  
  station = NULL,  
  nknots = 25L,  
  covariance = c("squared-exponential", "exponential", "matern"),  
  fixed_intercept = FALSE,  
  cluster = c("pam", "kmeans")  
)
```

**Arguments**

<code>data</code>	A data frame to be formatted
<code>y</code>	A numeric vector of the response
<code>X</code>	A matrix of the predictors
<code>time</code>	A character object giving the name of the time column
<code>lon</code>	A character object giving the name of the longitude column
<code>lat</code>	A character object giving the name of the latitude column
<code>station</code>	A numeric vector giving the integer ID of the station
<code>nknots</code>	The number of knots
<code>covariance</code>	The type of covariance function
<code>fixed_intercept</code>	Should the intercept be fixed?
<code>cluster</code>	The type of clustering algorithm used to determine the not locations. "pam" = <a href="#">pam</a> . <a href="#">kmeans</a> is faster for large datasets.

**Description**

Fit a spatiotemporal random fields model that optionally uses the MVT distribution instead of a MVN distribution to allow for spatial extremes through time. It is also possible to fit a spatial random fields model without a time component.

**Usage**

```
glmmfields(
  formula,
  data,
  lon,
  lat,
  time = NULL,
  nknots = 15L,
  prior_gp_theta = half_t(3, 0, 5),
  prior_gp_sigma = half_t(3, 0, 5),
  prior_sigma = half_t(3, 0, 5),
  prior_rw_sigma = half_t(3, 0, 5),
  prior_intercept = student_t(3, 0, 10),
  prior_beta = student_t(3, 0, 3),
  prior_phi = student_t(1000, 0, 0.5),
  fixed_df_value = 1000,
  fixed_phi_value = 0,
  estimate_df = FALSE,
  estimate_ar = FALSE,
  family = gaussian(link = "identity"),
  binomial_N = NULL,
  covariance = c("squared-exponential", "exponential", "matern"),
  matern_kappa = 0.5,
  algorithm = c("sampling", "meanfield"),
  year_re = FALSE,
  nb_lower_truncation = 0,
  control = list(adapt_delta = 0.9),
  save_log_lik = FALSE,
  df_lower_bound = 2,
  cluster = c("pam", "kmeans"),
  offset = NULL,
  ...
)
```

**Arguments**

formula            The model formula.

<code>data</code>	A data frame.
<code>lon</code>	A character object giving the name of the longitude column.
<code>lat</code>	A character object giving the name of the latitude column.
<code>time</code>	A character object giving the name of the time column. Leave as NULL to fit a spatial GLMM without a time element.
<code>nknots</code>	The number of knots to use in the predictive process model. Smaller values will be faster but may not adequately represent the shape of the spatial pattern.
<code>prior_gp_theta</code>	The prior on the Gaussian Process scale parameter. Must be declared with <code>half_t()</code> . Here, and throughout, priors that are normal or half-normal can be implemented by setting the first parameter in the half-t or student-t distribution to a large value. E.g. something greater than 100.
<code>prior_gp_sigma</code>	The prior on the Gaussian Process eta parameter. Must be declared with <code>half_t()</code> .
<code>prior_sigma</code>	The prior on the observation process scale parameter. Must be declared with <code>half_t()</code> . This acts as a substitute for the scale parameter in whatever observation distribution is being used. E.g. the CV for the Gamma or the dispersion parameter for the negative binomial.
<code>prior_rw_sigma</code>	The prior on the standard deviation parameter of the random walk process (if specified). Must be declared with <code>half_t()</code> .
<code>prior_intercept</code>	The prior on the intercept parameter. Must be declared with <code>student_t()</code> .
<code>prior_beta</code>	The prior on the slope parameters (if any). Must be declared with <code>student_t()</code> .
<code>prior_phi</code>	The prior on the AR parameter. Must be declared with <code>student_t()</code> .
<code>fixed_df_value</code>	The fixed value for the student-t degrees of freedom parameter if the degrees of freedom parameter is fixed in the MVT. If the degrees of freedom parameter is estimated then this argument is ignored. Must be 1 or greater. Very large values (e.g. the default value) approximate the normal distribution. If the value is $\geq 1000$ then a true MVN distribution will be fit.
<code>fixed_phi_value</code>	The fixed value for temporal autoregressive parameter, between random fields at time(t) and time(t-1). If the phi parameter is estimated then this argument is ignored.
<code>estimate_df</code>	Logical: should the degrees of freedom parameter be estimated?
<code>estimate_ar</code>	Logical: should the AR (autoregressive) parameter be estimated? Here, this refers to a autoregressive process in the evolution of the spatial field through time.
<code>family</code>	Family object describing the observation model. Note that only one link is implemented for each distribution. Gamma, negative binomial (specified via <code>nbinom2()</code> as <code>nbinom2(link = "log")</code> ), and Poisson must have a log link. Binomial must have a logit link. Also implemented is the lognormal (specified via <code>lognormal()</code> as <code>lognormal(link = "log")</code> ). Besides the negative binomial and lognormal, other families are specified as shown in <code>family</code> .
<code>binomial_N</code>	A character object giving the optional name of the column containing Binomial sample size. Leave as NULL to fit a spatial GLMM with sample sizes (N) = 1, equivalent to bernoulli model.

covariance	The covariance function of the Gaussian Process. One of "squared-exponential", "exponential", or "matern".
matern_kappa	Optional parameter for the Matern covariance function. Optional values are 1.5 or 2.5. Values of 0.5 are equivalent to exponential.
algorithm	Character object describing whether the model should be fit with full NUTS MCMC or via the variational inference mean-field approach. See <code>rstan::vb()</code> . Note that the variational inference approach should not be trusted for final inference and is much more likely to give incorrect inference than MCMC.
year_re	Logical: estimate a random walk for the time variable? If TRUE, then no fixed effects (B coefficients) will be estimated. In this case, <code>prior_intercept</code> will be used as the prior for the initial value in time.
nb_lower_truncation	For NB2 only: lower truncation value. E.g. 0 for no truncation, 1 for 1 and all values above. Note that estimation is likely to be considerably slower with lower truncation because the sampling is not vectorized. Also note that the log likelihood values returned for estimating quantities like LOOIC will not be correct if lower truncation is implemented.
control	List to pass to <code>rstan::sampling()</code> . For example, increase <code>adapt_delta</code> if there are warnings about divergent transitions: <code>control = list(adapt_delta = 0.99)</code> . By default, <b>glimmfields</b> sets <code>adapt_delta = 0.9</code> .
save_log_lik	Logical: should the log likelihood for each data point be saved so that information criteria such as LOOIC or WAIC can be calculated? Defaults to FALSE so that the size of model objects is smaller.
df_lower_bound	The lower bound on the degrees of freedom parameter. Values that are too low, e.g. below 2 or 3, it might affect chain convergence. Defaults to 2.
cluster	The type of clustering algorithm used to determine the knot locations. "pam" = <code>cluster::pam()</code> . The "kmeans" algorithm will be faster on larger datasets.
offset	An optional offset vector.
...	Any other arguments to pass to <code>rstan::sampling()</code> .

## Details

Note that there is no guarantee that the default priors are reasonable for your data. Also, there is no guarantee the default priors will remain the same in future versions. Therefore it is important that you specify any priors that are used in your model, even if they replicate the defaults in the package. It is particularly important that you consider that prior on `gp_theta` since it depends on the distance between your location points. You may need to scale your coordinate units so they are on a ballpark range of 1-10 by, say, dividing the coordinates (say in UTM's) by several order of magnitude.

## Examples

```
# Spatiotemporal example:
set.seed(1)
s <- sim_glimmfields(n_draws = 12, n_knots = 12, gp_theta = 1.5,
  gp_sigma = 0.2, sd_obs = 0.2)
print(s$plot)
```

```

# options(mc.cores = parallel::detectCores()) # for parallel processing
# should use 4 or more chains for real model fits
m <- glmmfields(y ~ 0, time = "time",
  lat = "lat", lon = "lon", data = s$dat,
  nknots = 12, iter = 1000, chains = 2, seed = 1)

# Spatial example (with covariates) from the vignette and customizing
# some priors:
set.seed(1)
N <- 100 # number of data points
temperature <- rnorm(N, 0, 1) # simulated temperature data
X <- cbind(1, temperature) # design matrix
s <- sim_glmmfields(n_draws = 1, gp_theta = 1.2, n_data_points = N,
  gp_sigma = 0.3, sd_obs = 0.1, n_knots = 12, obs_error = "gamma",
  covariance = "squared-exponential", X = X,
  B = c(0.5, 0.2)) # B represents our intercept and slope
d <- s$dat
d$temperature <- temperature
library(ggplot2)
ggplot(s$dat, aes(lon, lat, colour = y)) +
  viridis::scale_colour_viridis() +
  geom_point(size = 3)
m_spatial <- glmmfields(y ~ temperature, data = d, family = Gamma(link = "log"),
  lat = "lat", lon = "lon", nknots = 12, iter = 2000, chains = 2,
  prior_beta = student_t(100, 0, 1), prior_intercept = student_t(100, 0, 5),
  control = list(adapt_delta = 0.95))

```

---

lognormal

*Lognormal family*

---

## Description

Lognormal family

## Usage

```
lognormal(link = "log")
```

## Arguments

link                    The link (must be log)

## Examples

```
lognormal()
```

---

loo.glmfields	<i>Return LOO information criteria</i>
---------------	--

---

**Description**

Extract the LOOIC (leave-one-out information criterion) using `loo::loo()`.

**Usage**

```
## S3 method for class 'glmfields'
loo(x, ...)
```

**Arguments**

x	Output from <code>glmfields()</code> . Must be fit with <code>save_log_lik = TRUE</code> , which is <i>not</i> the default.
...	Arguments for <code>loo::relative_eff()</code> and <code>loo::loo.array()</code> .

**Examples**

```
set.seed(1)
s <- sim_glmfields(n_draws = 12, n_knots = 12, gp_theta = 1.5,
  gp_sigma = 0.2, sd_obs = 0.2)
# options(mc.cores = parallel::detectCores()) # for parallel processing

# save_log_lik defaults to FALSE to save space but is needed for loo():
m <- glmfields(y ~ 0, time = "time",
  lat = "lat", lon = "lon", data = s$dat,
  nknots = 12, iter = 1000, chains = 4, seed = 1,
  save_log_lik = TRUE)
loo(m)
```

---

nbinom2	<i>Negative binomial family</i>
---------	---------------------------------

---

**Description**

This is the NB2 parameterization where the variance scales quadratically with the mean.

**Usage**

```
nbinom2(link = "log")
```

**Arguments**

link	The link (must be log)
------	------------------------

**Examples**

```
nbinom2()
```

---

plot.glmfields	<i>Plot predictions from an glmfields model</i>
----------------	---

---

**Description**

Plot predictions from an glmfields model

**Usage**

```
## S3 method for class 'glmfields'
plot(
  x,
  type = c("prediction", "spatial-residual", "residual-vs-fitted"),
  link = TRUE,
  ...
)
```

**Arguments**

x	An object returned by <a href="#">glmfields</a>
type	Type of plot
link	Logical: should the plots be made on the link scale or on the natural scale?
...	Other arguments passed to <a href="#">predict.glmfields</a>

**Examples**

```
# Spatiotemporal example:
set.seed(1)
s <- sim_glmfields(n_draws = 12, n_knots = 12, gp_theta = 1.5,
  gp_sigma = 0.2, sd_obs = 0.1)
# options(mc.cores = parallel::detectCores()) # for parallel processing
m <- glmfields(y ~ 0, time = "time",
  lat = "lat", lon = "lon", data = s$dat,
  nknots = 12, iter = 600, chains = 1)
x <- plot(m, type = "prediction")
x
x + ggplot2::scale_color_gradient2()
plot(m, type = "spatial-residual")
plot(m, type = "residual-vs-fitted")
```

---

predict	<i>Predict from a glmmfields model</i>
---------	--

---

### Description

These functions extract posterior draws or credible intervals. The helper functions are named to match those in the **rstanarm** package and call the function `predict()` with appropriate argument values.

### Usage

```
## S3 method for class 'glmmfields'
predictive_interval(object, ...)

## S3 method for class 'glmmfields'
posterior_linpred(object, ...)

## S3 method for class 'glmmfields'
posterior_predict(object, ...)

## S3 method for class 'glmmfields'
predict(
  object,
  newdata = NULL,
  estimate_method = c("median", "mean"),
  conf_level = 0.95,
  interval = c("confidence", "prediction"),
  type = c("link", "response"),
  return_mcmc = FALSE,
  offset = NULL,
  iter = "all",
  ...
)
```

### Arguments

object	An object returned by <code>glmmfields()</code> .
...	Ignored currently
newdata	Optionally, a data frame to predict on
estimate_method	Method for computing point estimate ("mean" or "median")
conf_level	Probability level for the credible intervals.
interval	Type of interval calculation. Same as for <code>stats::predict.lm()</code> .
type	Whether the predictions are returned on "link" scale or "response" scale (Same as for <code>stats::predict.glm()</code> ).

return\_mcmc      Logical. Should the full MCMC draws be returned for the predictions?  
 offset            Optional offset vector to be used in prediction.  
 iter              Number of MCMC iterations to draw. Defaults to all.

## Examples

```
library(ggplot2)

# simulate:
set.seed(1)
s <- sim_glmfields(
  n_draws = 12, n_knots = 12, gp_theta = 2.5,
  gp_sigma = 0.2, sd_obs = 0.1
)

# fit:
# options(mc.cores = parallel::detectCores()) # for parallel processing
m <- glmfields(y ~ 0,
  data = s$dat, time = "time",
  lat = "lat", lon = "lon",
  nknots = 12, iter = 800, chains = 1
)

# Predictions:
# Link scale credible intervals:
p <- predict(m, type = "link", interval = "confidence")
head(p)

# Prediction intervals on new observations (include observation error):
p <- predictive_interval(m)
head(p)

# Posterior prediction draws:
p <- posterior_predict(m, iter = 100)
dim(p) # rows are iterations and columns are data elements

# Draws from the linear predictor (not in link space):
p <- posterior_linpred(m, iter = 100)
dim(p) # rows are iterations and columns are data elements

# Use the `tidy` method to extract parameter estimates as a data frame:
head(tidy(m, conf.int = TRUE, conf.method = "HPDinterval"))

# Make predictions on a fine-scale spatial grid:
pred_grid <- expand_grid(
  lat = seq(min(s$dat$lat), max(s$dat$lat), length.out = 25),
  lon = seq(min(s$dat$lon), max(s$dat$lon), length.out = 25),
  time = unique(s$dat$time)
)
pred_grid$prediction <- predict(m,
  newdata = pred_grid, type = "response", iter = 100,
  estimate_method = "median", offset = rep(0, nrow(pred_grid))
)
```

```

)$estimate

ggplot(pred_grid, aes(lon, lat, fill = prediction)) +
  facet_wrap(~time) +
  geom_raster() +
  scale_fill_gradient2()

```

---

 sim\_glmfields

*Simulate a random field with a MVT distribution*

---

## Description

Simulate a random field with a MVT distribution

## Usage

```

sim_glmfields(
  n_knots = 15,
  n_draws = 10,
  gp_theta = 0.5,
  gp_sigma = 0.2,
  mvt = TRUE,
  df = 1e+06,
  seed = NULL,
  n_data_points = 100,
  sd_obs = 0.1,
  covariance = c("squared-exponential", "exponential", "matern"),
  matern_kappa = 0.5,
  obs_error = c("normal", "gamma", "poisson", "nb2", "binomial", "lognormal"),
  B = c(0),
  phi = 0,
  X = rep(1, n_draws * n_data_points),
  g = data.frame(lon = runif(n_data_points, 0, 10), lat = runif(n_data_points, 0, 10))
)

```

## Arguments

n_knots	The number of knots
n_draws	The number of draws (for example, the number of years)
gp_theta	The Gaussian Process scale parameter
gp_sigma	The Gaussian Process variance parameter
mvt	Logical: MVT? (vs. MVN)
df	The degrees of freedom parameter for the MVT distribution
seed	The random seed value
n_data_points	The number of data points per draw

sd_obs	The observation process scale parameter
covariance	The covariance function of the Gaussian process ("squared-exponential", "exponential", "matern")
matern_kappa	The optional matern parameter. Can be 1.5 or 2.5. Values of 0.5 equivalent to exponential model.
obs_error	The observation error distribution
B	A vector of parameters. The first element is the intercept
phi	The auto regressive parameter on the mean of the random field knots
X	The model matrix
g	Grid of points

### Examples

```
s <- sim_glmfields(n_draws = 12, n_knots = 12, gp_theta = 1.5,
  gp_sigma = 0.2, sd_obs = 0.2)
names(s)
```

---

stan_pars	<i>Return a vector of parameters</i>
-----------	--------------------------------------

---

### Description

Return a vector of parameters

### Usage

```
stan_pars(
  obs_error,
  estimate_df = TRUE,
  est_temporalRE = FALSE,
  estimate_ar = FALSE,
  fixed_intercept = FALSE,
  save_log_lik = FALSE
)
```

### Arguments

obs_error	The observation error distribution
estimate_df	Logical indicating whether the degrees of freedom parameter should be estimated
est_temporalRE	Logical: estimate a random walk for the time variable?
estimate_ar	Logical indicating whether the ar parameter should be estimated
fixed_intercept	Should the intercept be fixed?
save_log_lik	Logical: should the log likelihood for each data point be saved so that information criteria such as LOOIC or WAIC can be calculated? Defaults to FALSE so that the size of model objects is smaller.

---

student_t	<i>Student-t and half-t priors</i>
-----------	------------------------------------

---

### Description

Student-t and half-t priors. Note that this can be used to represent an effectively normal distribution prior by setting the first argument (the degrees of freedom parameter) to a large value (roughly 50 or above).

### Usage

```
student_t(df = 3, location = 0, scale = 1)
```

```
half_t(df = 3, location = 0, scale = 1)
```

### Arguments

df	Degrees of freedom parameter
location	Location parameter
scale	Scale parameter

### Examples

```
student_t(3, 0, 1)
half_t(3, 0, 1)
```

---

tidy	<i>Tidy model output</i>
------	--------------------------

---

### Description

Tidy model output

### Usage

```
tidy(x, ...)
```

```
## S3 method for class 'glmfields'
tidy(x, ...)
```

### Arguments

x	Output from <code>glmfields()</code>
...	Other arguments
